

Things I liked.

1. There was an easily accessible option to show frequently used applications. This seems like it would be useful and make using the system more streamlined.
2. Right clicking on the desktop brought up several useful options, including "New Folder" and "Change Background". Both of these are more difficult on some other operating systems.
3. One of the applications initially listed in the dock was "Help". It takes you through the basics of using Ubuntu. I think other OS's could benefit from something like this.
4. It came with minesweeper, which was helpful when I got bored.
5. Clicking "Activities" in the upper left corner brought up a search bar that lets you search through all of your applications. This seems like it would be a quick way to find an application you were looking for.
6. The ability to resize icons is a fun little feature I haven't seen before. Not sure how useful it is though.
7. Each application in the dock had dots next to it's icon equal to the number of windows open.
8. At the top of the screen, next to "Activities", it showed you which application you currently have selected.
9. The calendar made it very easy to see events and see when they are coming up.
10. When right clicking on a folder, I got the option to open it in the terminal. This is a nice feature that would make working in the terminal that much easier.

Things I didn't like:

1. Many of the windows would take longer than I am used to to open and close. It was nothing significant, but I did notice it.
2. I couldn't figure out how to center the dock when it was on the bottom of the window.
