

The “top” command gives you a list of all processes being run on the server.

1. The “ps” command shows a list of your active processes.
2. The “ps -f” command displays additional information about the processes.
3. The “ps -e” command shows all processes, including ones that are not being run by a user.
4. The “ps -u *username*” command shows a list of that user’s active processes. Adding -l as well puts it in a longer format.
5. The “ps -a” command shows only processes associated with a terminal.
6. The “ps -l” command shows additional information about your active processes.
7. The “ps p” command return processes based on their process ID.
8. The “kill” command sends a signal to a process.
9. The “fg” command puts a background process in the foreground.
10. The “bg” command puts a process in the background.
